INTRODUCTION

If your computer is still running hot after cleaning the fan, you should remove the heat sink to check that it is not damaged.

TOOLS:

- [Phillips #1 Screwdriver](#) (1)
 - [Spudger](#) (1)
 - [Arctic Silver ArctiClean](#) (1)
 - [Arctic Silver Thermal Paste](#) (1)
 - [Coffee Filters or a lint-free cloth](#) (1)
-

Step 1 — Battery

- Turn the computer upside down with the battery facing you.

- ⓘ Turn the computer off and disconnect the charging cable from the computer.

⚠ Failure to unplug the charging cable may result in electric shock.

Step 2

- Push the switch as far to the right as possible to unlock the battery.

Step 3

- Remove the battery using two hands and pull it away from the computer.

Step 4 — Heat Sink

- Unscrew the four Phillips #1 screws holding down the back panel. Then remove one 5.8mm Phillips #1 screw labeled "M" in the middle of the back panel.
- Four 3.9mm Phillips #1 screws
- One 5.8mm Phillips #1 screw

Step 5

- Using the highlighted indent, pull up and out to remove the back panel.

i The indent should provide enough grip to remove the panel with ease.

Step 6

- First, unscrew the six screws that are holding down the fan and heat sink with a Philips #1 screwdriver. Then use a Phillips #1 to remove the single screw near the bottom of the heat sink.

- Six Silver Chrome 5.8mm Phillips #1 screws
- One 5.8mm Phillips #1 screw

⚠ Remove the four screws that are holding down the CPU (the four to the top left that form a rectangle in this image) first. Unscrew them in an X pattern (eg. top left screw, bottom right screw, top right screw, bottom left screw) to minimize risk of harming CPU.

Step 7

- Carefully lift the fan and heat sink from the laptop.
- ⓘ Be careful not to pull up too hard, because the power pin is still connecting the fan to the laptop.

Step 8

- Use your fingers or a spudger to remove the power pin connecting the fan to the laptop by pulling it straight up off the motherboard.

Step 9

- Remove the fan and heat sink from the laptop.
- ☑ When installing the new heat sink, do not forget to replace the thermal paste underneath the heat sink. See iFixit's [Applying Thermal Paste](#) guide for further instructions.

To reassemble your device, follow these instructions in reverse order.
